

How to Clean Up Nitric Acid Spill

Step 1: Supplies

Here are the supplies you will need to clean up a nitric acid chemical spill:

- Mask
- Goggles
- Gloves
- Acid-Resistant Apron
- Broom
- Plastic Dustpan
- Amphomag

While you may be able to clean the spill without protection if none is available, it again may be better to call in a team to avoid exposure depending on your level of training.

Step 2: Clean Up

Follow these 3 easy steps to cleaning up a nitric acid spill using Amphomag.

1. Pour Amphomag slowly and directly onto the nitric acid spill to contain and neutralize.
2. The Amphomag will initially turn reddish/pink to indicate that it is an acid and when fully neutralized will turn to a yellow/green color.
3. If there is any nitric acid remaining anywhere, repeat step 2 until all nitric acid is gone.

Step 3: Disposal

The contained and neutralized spill is now ready to be disposed of as a non-hazardous material. Use a broom and plastic dust pan to sweep up the Amphomag.
